RESEARCH PLAN OVERVIEW

OLIVE REVAMP (INCLUDING UNBOXING)

MANAGE USAGE

CARD LOCKING

PAY NOW

Research Goal

The study aimed to gather feedback for the journeys 'Manage Usage', 'Pay Now (CASA)', and 'Olive Revamp'. The team wants to understand any issues that existing users are facing with the current journeys and gather any changes they would like to be made.

1. **Evaluate user behaviour** within the journeys and **identify pain points**.
2. Gather **overall feedback** and **potential change requests** from users.
3. Evaluate user experience and gather **user preference of the revamped design** for multi card usage.

User Profile and methodology

- Having credit cards of axis bank as well as other banks
- Using axis credit card since more than 1 year
- Frequency of axis credit card transactions: medium to high (>10 transactions per month)

Number of axis cards	Joined Axis	Frequency of Axis app usage	Card Variant
Single	Directly	at least once or twice in a month	Premium
			Non- premium
	Migrated from Citibank	3 or more than 3 times in a month	Premium
			Non- premium
		at least once or twice in a month	Premium
			Non- premium
Multiple cards with add ons	Directly	at least once or twice in a month	Premium
			Non- premium
	Migrated from Citibank	3 or more than 3 times in a month	Premium
			Non- premium
		at least once or twice in a month	Premium
			Non- premium

User Interview Schedule

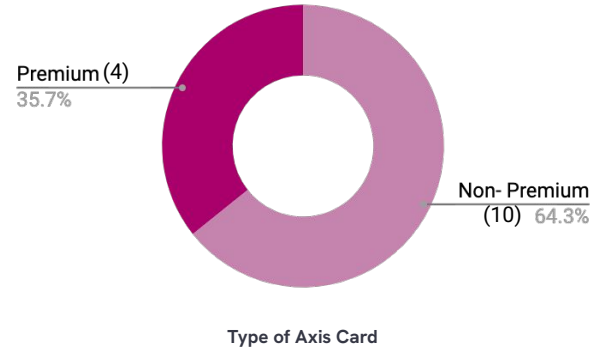

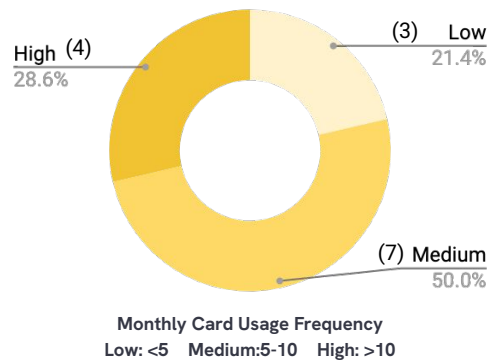

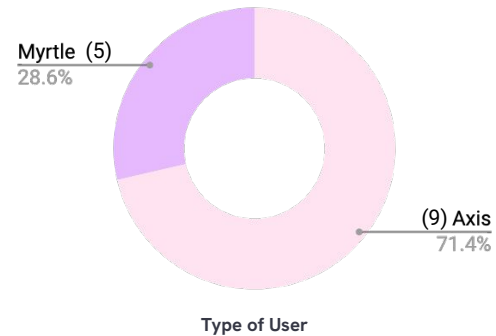

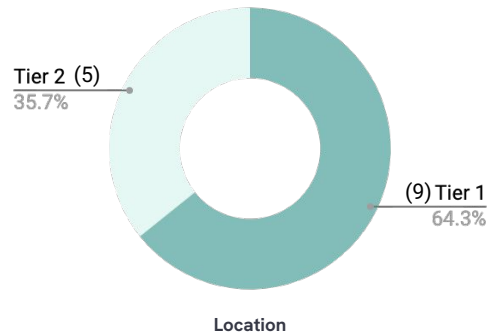

~90 minute usability testing sessions of the Manage Usage, Pay Now, and Olive Revamp journeys.
Users were given prototypes to interact with.

Participant Distribution

Participant Card and App Usage

Most users started using a credit card between the age of 20-30. 43% of them people start using a credit card between 25-30 and 29% people started between 20-25.

- More than half of the users who have a single Axis card, have cards from other banks as well.
 - Most of them have one extra card and very few of them have 2 extra cards.
 - ONE card is the most popular extra card that these users had, followed by HDFC, and SBI.
 - Both the HNI users in our cohort had AMEX cards
- Most users use the respective bank apps of each card.
- The Axis app is most frequently used to check statements, check transactions, and check utilised-available limit.

Olive Revamp

User Focus

23%

focused on the
top section

For some users, the upgradation was the first thing they noticed due to its placement and font size.

NOTIONAL HEATMAP

62%

The card section was the first thing that caught their eye. This includes the card and the buttons below it.

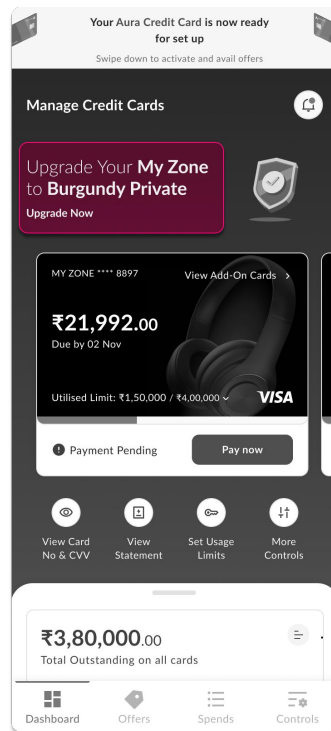

Lighter components get highlighted well due to the contrast with their darker background.

Card image is attractive due to the black and burgundy combination.

Upgrading the credit card

The visibility and understanding of the card upgradation is very high. Most users noticed it in their first exploration of the design. However users were not actively enthusiastic about it.

- An HNI user disliked it as he would prefer not to see any offers/ promotions and expects the RM to handle such things.
- A premium user was interested in the feature as he called himself a 'card enthusiast'.
- A Myrtle user was happy as the section meant less calls from the bank.
- A Tier 2, 40+ age user found it difficult to understand the copy (he did not understand what 'burgundy private' meant) and also expected the upgradation section to be about security due to the shield illustration beside it.

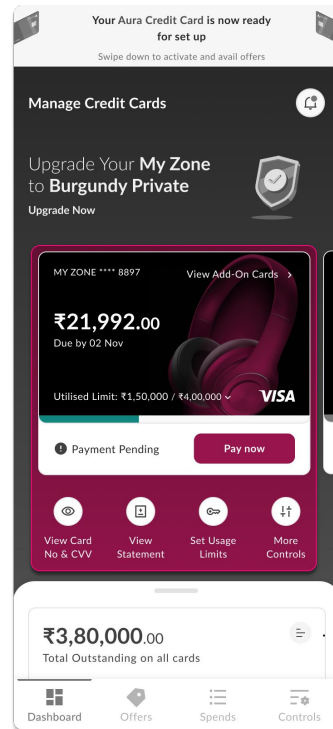

'When you open Google, there's nothing, it's just plain. I prefer something of that sort. It's the best search engine in the world despite not having anything on the homepage.'

-45, Tier 1, Premium

Functions and Info components

Both, 'Pay Now' and the buttons below card have very high visibility and were the most identified functions that can be performed using the design. This is due to them being visually highlighted as the lighter UI contrasts well with the darker background, making the buttons pop.

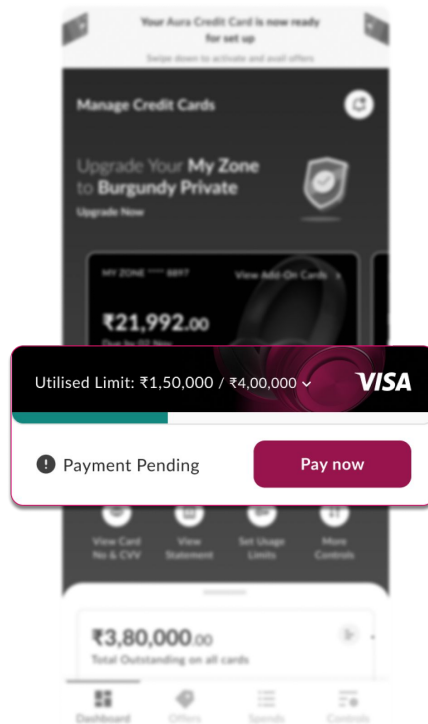

- Most details on the card— card name, View add-on button, Due Amount and Due date, Utilised Limit— were noticed and understood correctly by all users as their lighter text also popped against the darker card background.
- Most users scrolled down till the 'Convert to EMI' section during their initial exploration.
 - Few users scrolled completely to the end of the page.
 - Very few users did not scroll at all.

Utilised Limit: Arrow

More than 60% users **did not** notice the arrow beside utilised limit due to its small size and their focus being on other things.

- Half of the users expect to see a breakup of their spends due to its placement near 'Utilised Limit'.
- They expect to see some sort of categorisation of where and how much they have "utilised"/spent.
- Very few users expected the arrow was a graphical element and it pointed to the green bar

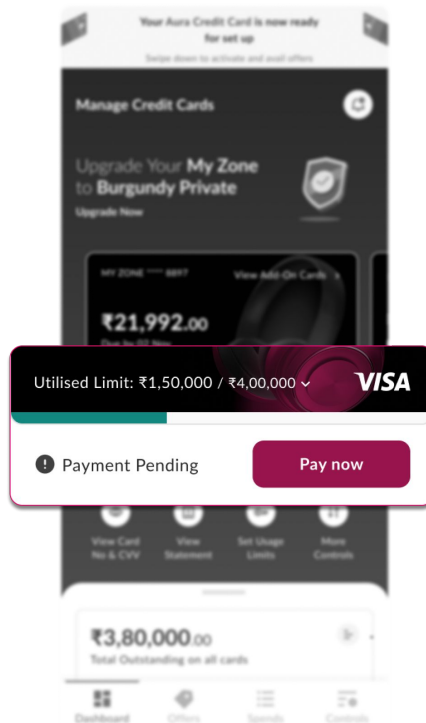

Utilised Limit: Green Bar

Almost 60% users noticed the green bar initially but some of them mistook it for a design element as it felt insignificant in the first glance compared to rest of the screen.

But overall, most users were able to understand its purpose correctly after sometime.

- Few users were unable to deduce the percentage used which they usually use to budget and spend accordingly.
- A user has EMIs and he often tries to keep in mind this 'blocked limit' that he cannot spend which reduces his actual available limit.

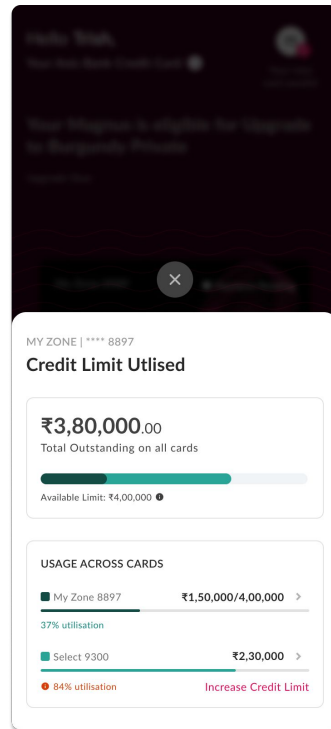

Total Limit Breakup (for more than one card users)

Visibility and understanding of the Limit Breakup menu button is very high as all users noticed it. The popup was also mostly easy for users to understand and they found the overall feature very helpful.

However there were a few areas of friction that some users shared

- "Select 9300" was not seeming like a card name since it was a common term and hence confused the user
- Using lines to represent the different usage of limits was slightly difficult to consume since a user had to go back and forth between the top and bottom section to make sense of the data. He suggested the use of a pie graph instead.
- A 40+ user had accessibility issues due to font sizes being small for him. He also felt the colors were not easily distinguishable, especially for 'used' and 'available' limits.

4.8/5

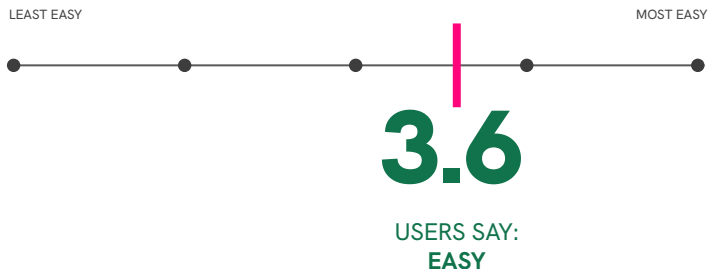

USERS RATE:
VERY EASY

4.4/5

USERS RATE:
HELPFUL

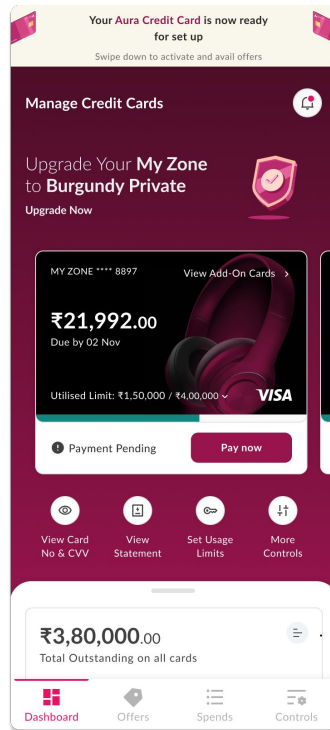

Card Unboxing: Process Feedback

The process itself, of card activation is relatively easy for users. But half of the users had some issues.

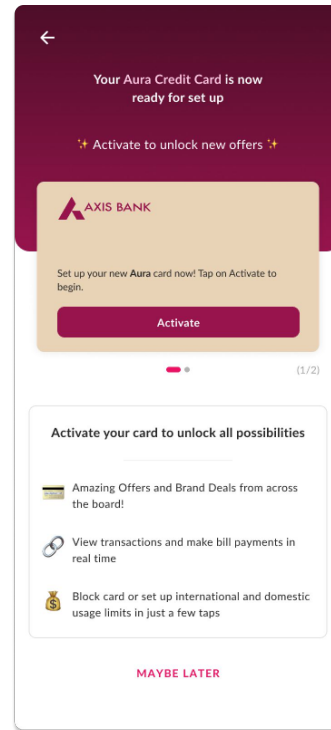

Areas of friction

- Efforts needed to locate the the banner at the very top as most of their focus is below it since the card section is attractive and has all the major functions.
- Misunderstanding banner as some offer since the placement is common across apps for advertisements.
- Swipe down interaction is misunderstood and slightly difficult compared to just clicking.

ACTIVATION BANNER AT THE TOP

ACTIVATION PAGE

Card Unboxing: Banner Visibility & Feedback

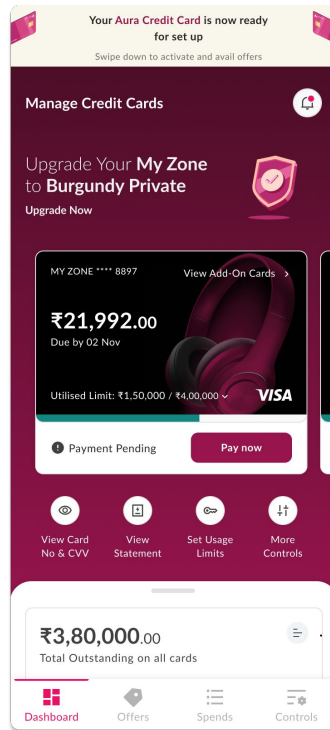

Half of the users had low visibility for the banner and most of these said that they were only focussed on the central section, thus completely ignoring the banner.

"Usually if someone lands on the home page, he or she is trying to see (important details) like how much is outstanding and what is the due date. Hence rest everything gets unnoticed. (Banner) it is very on the top. So it should be somewhere the middle or where there's more blank space"

-29, Tier 1

Almost half of the users mistook the banner for an advertisement or popup due to the expectation of such content being placed at the very top in most apps.

Some of the users, who initially saw the banner by themselves, still mistook it or felt it could easily be ignored.

ACTIVATION BANNER AT THE TOP

'ACTIVATION' TASK

User were trying to check which options would allow to do all the formalities needed for activation hence they ended up focussing on all the buttons available on the central part of the screen.

Card Name is a successful nudge which indicates unboxing would have higher rate of success when users remember their new card's name.

Card Unboxing: Navigation

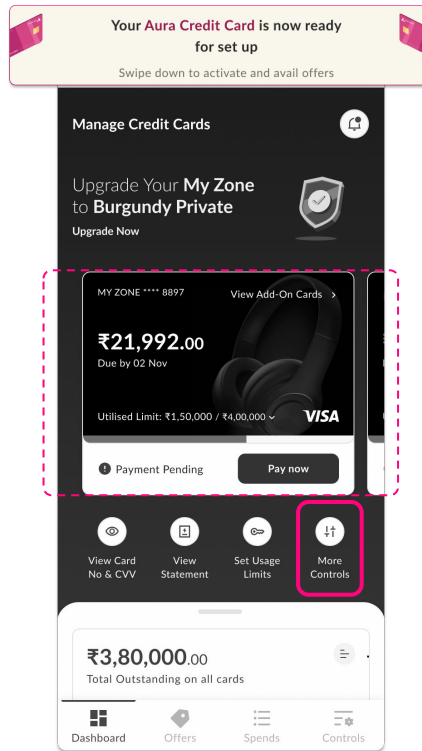

More than half of the users took 2 tries to find an option to activate and setup card.

When trying to discover an option for activating and setting up a new card, only 35% users chose the banner as their first choice.

More than 60% users did not choose the banner as their first choice.

'More Controls' was the most popular first choice due to the copy being indicative of such formalities.

Some users expected it to be revealed by swiping on the card due to relating it to the design where card is shown upfront.

BANNER INTERACTION

More than 40% users scrolled down on the entire screen rather than swiping down on the banner itself due to lack of any indicator and banner not being perceived as interactive.

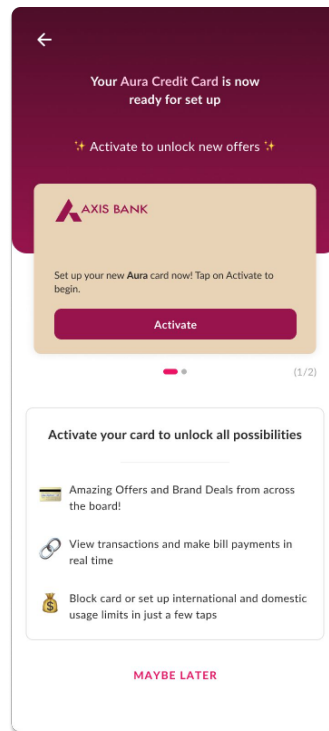

Adding an arrow or just making the banner clickable were the top suggestions to avoid this confusion.

'MORE CONTROLS' WAS MOST POPULAR FOR NAVIGATION

Card Unboxing: Activation

The visibility of the card carousel on the activation screen is very high. Majorly, user expectations were around seeing more info (either about card or its offer or the activation process after swiping to the second section).

- Premium users were more privy to the way the card looked and voiced wanting to see something better/ attractive rather than a simple beige rectangle.
- User awareness is high and their expectations after clicking on activate are well aligned with the card setup process. They foresee formalities like PIN, OTP, mPIN, card details, etc.

"agar pehle par card hai toh
next uske benefits bataye
honge shayad"

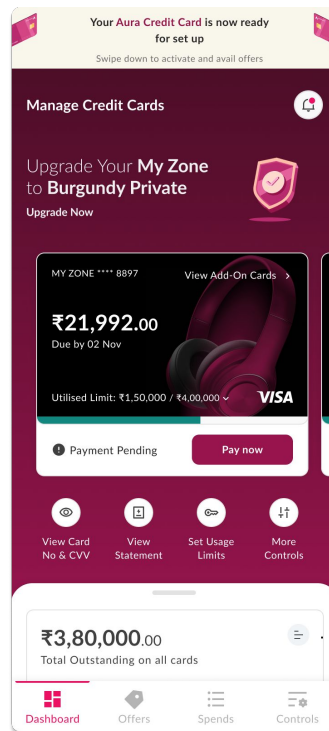

-36, Tier 1

Preference: Revamp Versions

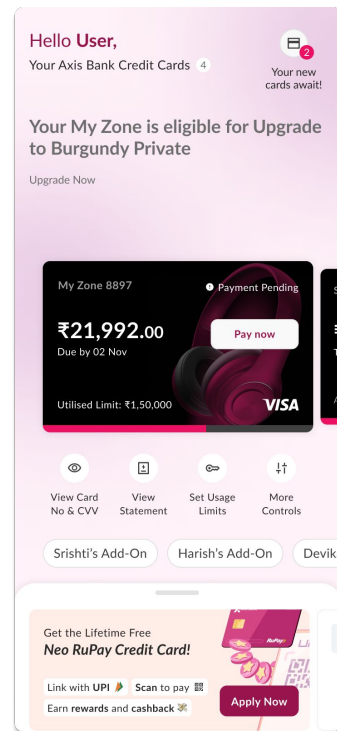

Overall both designs have almost equal preference. However, Non Premium preferred Revamp A slightly more and Premium Users preferred Revamp B slightly more.

"Axis is like SBI; branch ka maahol aisa rehta hai jaise government bank ka hai. Citi bank gave premium feeling- their least balance for opening account is at 1Lac. Now if a user is migrating from Citi to Axis, Axis should have something different for Citi users than Axis users."

-42, Tier 1, Myrtle

REVAMP A

REVAMP B

Feedback: Revamp A

COLOUR COMBO

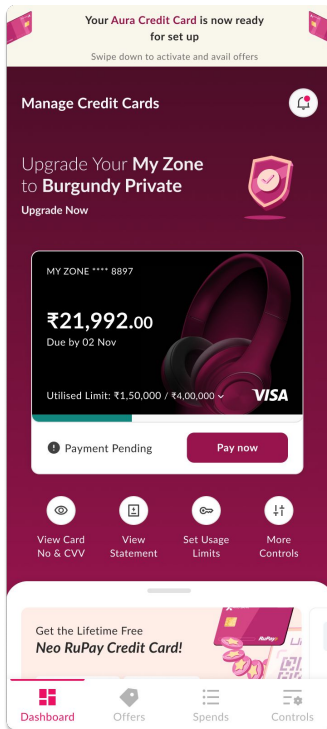

Attractive, Premium, On theme for Axis

CONTRAST

Lighter UI gets highlighted on the darker background

LAYOUT

All important information/buttons are available upfront and reduce the need to scroll down

BURGUNDY

Too 'Axis', nothing premium or special for Citibank users, Gaudy and not soothing

ADS

Ads shown upfront but they are disinterested in card offers and would like to just focus on their tasks for which they have opened the app. Multiple offer sections also clutters the screen.

INTERACTIONS

It can sometimes be tiring to have different kinds of interaction within the same screen. Multiple interactive sections could also lead to accidental clicking when user is just trying to scroll down.

WHAT'S WORKING FOR MOST?

REVAMP A

WHAT'S NOT WORKING FOR SOME?

Feedback: Revamp B

LOOKS

Subtle, Clean, Premium feel

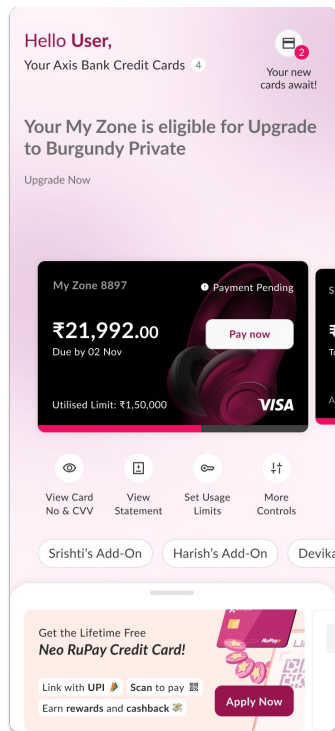

GREETING

Adds a personalized touch

ADD ON PILLS

Providing the pills upfront, makes it quick and easy to access add-on cards (this was also mentioned by users who preferred Revamp A)

WHAT'S WORKING FOR MOST?

REVAMP B

BACKGROUND

Overall theme is very plain and feel the design is simple, obsolete, unattractive and dull

LOW CONTRAST

Lighter UI on the lighter background makes it difficult to quickly view things as nothing pops

WHAT'S NOT WORKING FOR SOME?

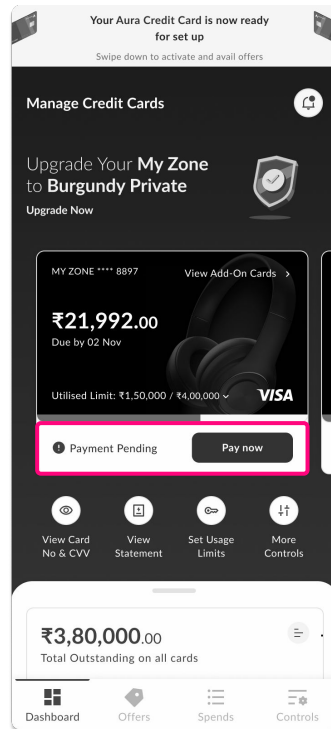

Preference: Pay Now, Notification

75% users preferred Revamp A for the Pay Now Button with the most popular reason being the button highlighted better.

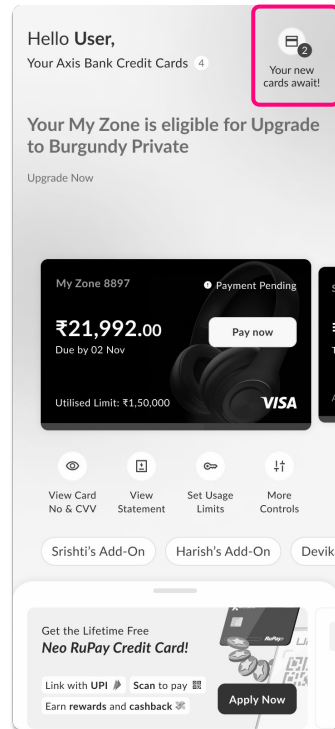

- Few users also liked Revamp A for its 'Payment Pending' nudge which was better placed beside 'Pay Now' just below the card.
- All users who preferred Revamp B for 'Pay Now' liked it since the dimensions of card were retained by placing the button onto the card.

More than 60% users preferred Revamp B for the Notification with the most popular reason being the number which users said was helpful.

- But some users preferred the Banner in Revamp A over the simple copy 'Your new cards await' in Revamp B.
- Few users preferred the bell icon in Revamp A due to its familiarity.

REVAMP A
(preferred more for Pay Now)

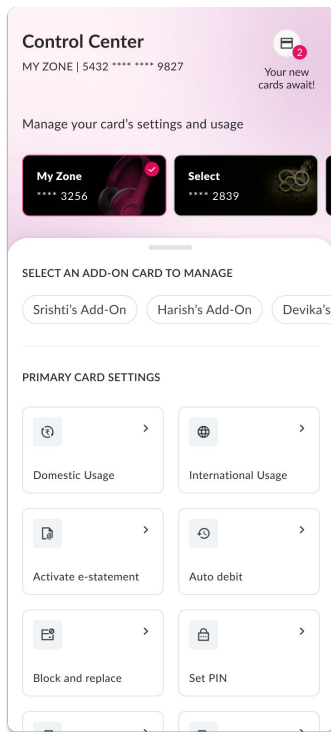

REVAMP B
(preferred more for Notifications)

Preference: Switching to other or add-on card

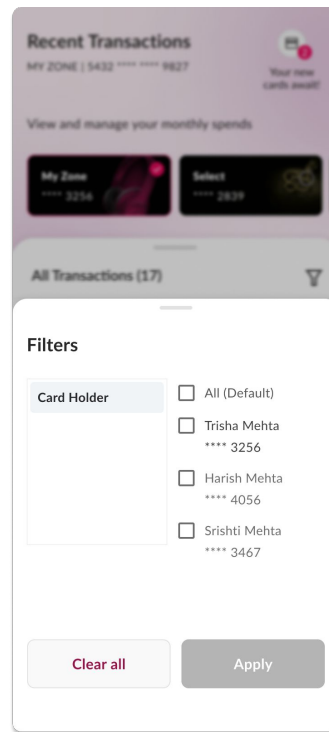

The major user needs for card switching are ease of use and faster switching.

The order of preference for switching cards is

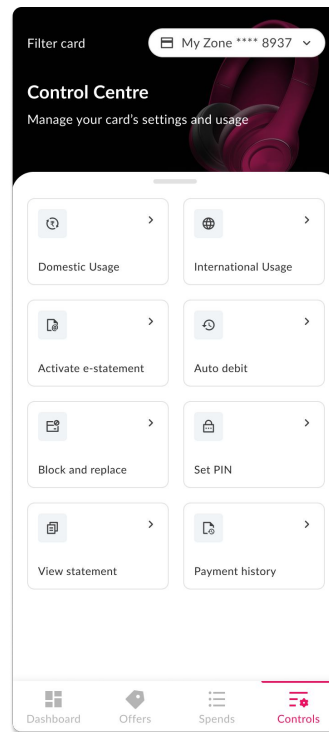

1. Pills
2. Filter
3. Dropdown

RANK 1: PILLS

RANK 2: FILTER

RANK 3: DROPDOWN

Feedback: Pills

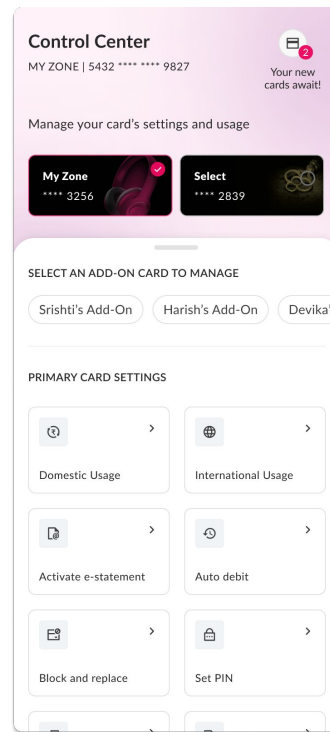

Pills are the most preferred method of switching between cards as it is the fastest— the experience is limited to one page/ section

Comparatively, both filter and dropdown have more number of steps as users need to open and close sections when switching cards.

- Visibility of carousel is very high but it is slightly lower for the add on pills.
 - Card image is eye catching and user end up focussing on the carousel more
 - Pills don't highlight as they are white on white.
- Few users thought the 'Select' is their add-on card swiped the carousel expecting others to also be there.

"If you have given Srishti's add on below, why are showing me the card image above?"

-45, Tier 1

VISUAL AID

Images of card provide visual cue and it helps to quickly select a card

PLACEMENT

Add on are shown upfront as pills thus eliminating extra steps; the entire switching is done within maximum 2 steps.

SWITCHING WITH PILLS IS QUICK

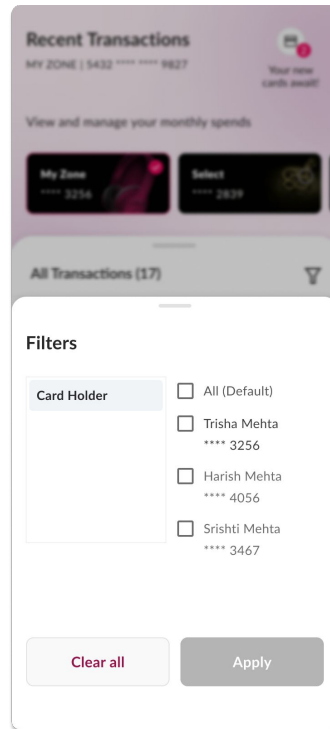

Feedback: Filter

Overall, users also expect 'multi select' if needed, as it also reduces number of steps required if they need to compare data (ex. who did a certain transaction) or apply settings of limits.

- Despite the initial unexpectancy of the filter, all users understood well after they opened it and were able to use the filter correctly.

"what I understand here in this new design is like we are trying to reduce or saving some time. You can select multiple cards. Whichever card you want to settle it, you want to have the same limit."

-31, Tier 1

ICON DISSONANCE

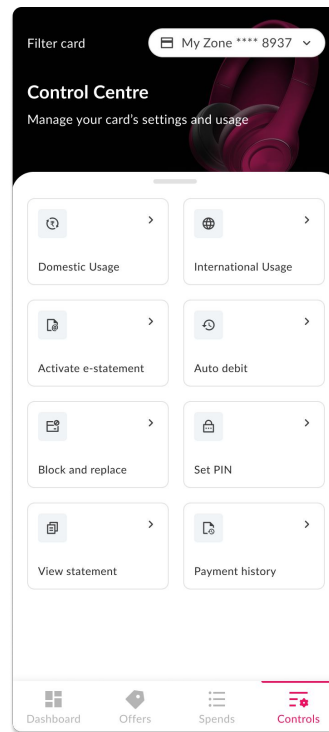

The drawback is that users expect to sort by date (in case of transactions) using the 'filter' icon.

MULTI SELECT IS HIGHLY PREFERRED

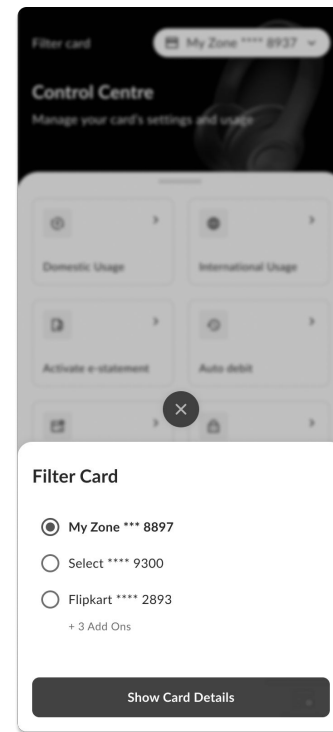

Feedback: Dropdown

Overall, the dropdown, though easy to use, is least favourable due to lack of multi select and more number of steps.

- Visibility and understanding of dropdown is high.
- But few users had issues switching to addon cards (2/2)
 - A user (40+ age) did not notice +3 as it was small
 - A user misunderstood +3 as an option to add more cards to the list
- Most users though they would see the selected card, or its details like card number, when clicking on the CTA due to its copy.

STEP 1: CLICK ON DROPDOWN

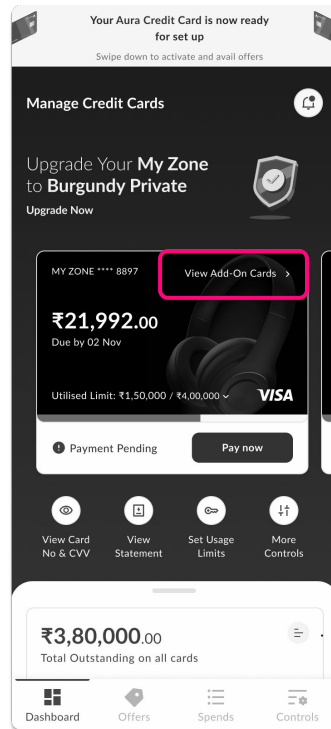

STEP 2: CHOOSE CARD

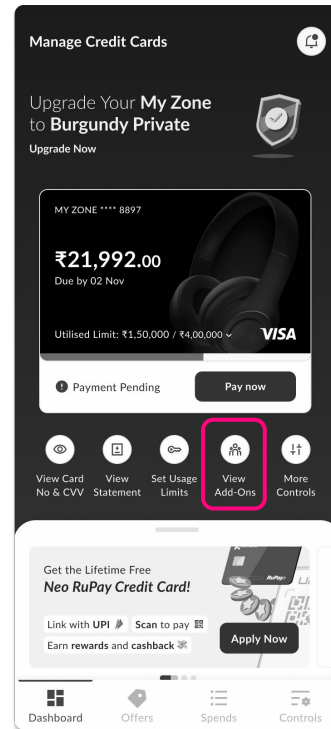

Preference: Viewing Add on

Option A was most preferred for viewing add-on cards. The main reason for this is the location which users feel is quick to find and how well the light text contrasts on the darker card image.

- Also, too many buttons on Option B make it feel cluttered and it took users slightly longer than Option A to find the required button.

OPTION A: ON THE CARD

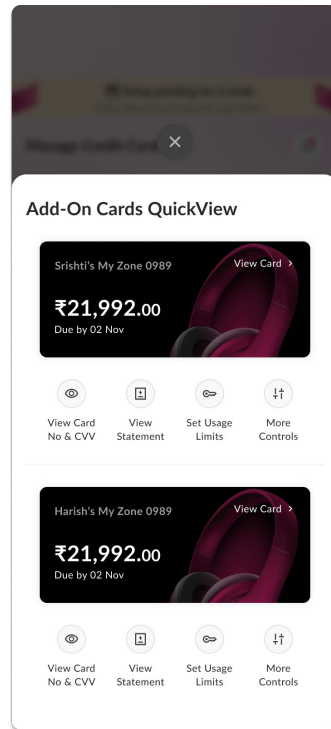

OPTION B: BUTTON BELOW CARD

Feedback: Add-On Quickview

Users found the Quick View section very easy to understand.

- Few users felt the options to view the card were repetitive- text on card, button below card.
- Few users expect that the card details (like cvv, expiry, or transactions) will be shown when clicking on 'View Card'.
- They mostly expect these details to be shown there itself inside quickview.

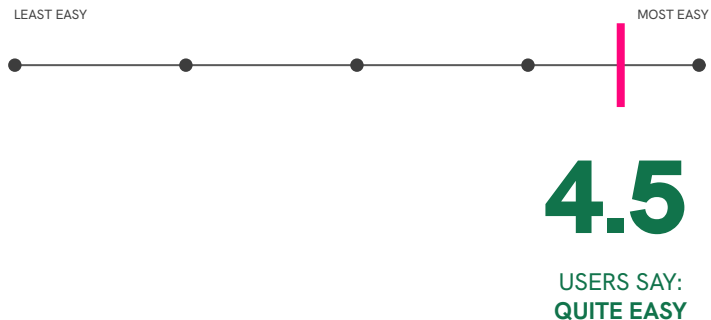

ADD-ON CARD QUICKVIEW

Manage Usage

Manage Usage: Process Feedback

Overall, the process of managing and changing the usage limit is easy for all users. On an average, it was rated 4.5/5

There were no particular areas of friction.

But following is a list of a few pain points received from the users

1. A premium user felt the process was slightly lengthy as she needed to go deeper in the app to access the limits. She mainly uses the axis app for formalities like these and hence expects them to be easier and faster.
1. A 40+ aged user had accessibility issues regarding the font size for the sub-info.
1. Few users from Tier 1 (with low frequency of using Axis app) felt the dashboard was overwhelming due to too much text and options.

Manage Usage: Process Feedback

The frequency of users managing/ changing usage limits is very low but it is still an important function. It helps users feel in control of their card and is a helpful feature for those who share their card sometimes.

On an average, users rated the importance of the feature at 3.8/5

- Most users rarely change usage limits (some only when travelling abroad)
- Some users have never changed their limits after activation.

3.8

USERS SAY:
QUITE IMPORTANT

"...generally I have control on myself. It's not like that I spend endlessly or without any reason. But sometimes like for example, you are giving your card to your family member or you feel that something fishy has happened. Maybe you click some link..then you can block the card from there or you can set the transaction limit just to avoid any fraud."

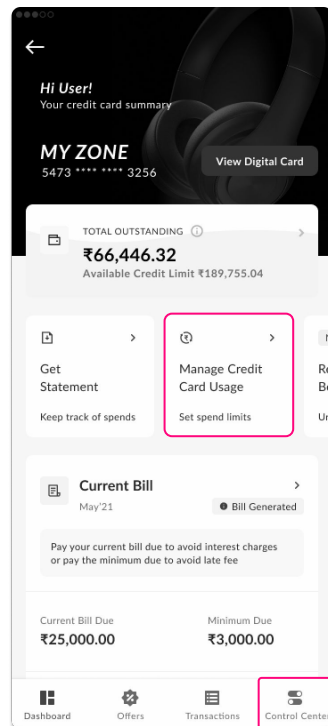

-32, Tier 1

Choice of Navigation- Start Point

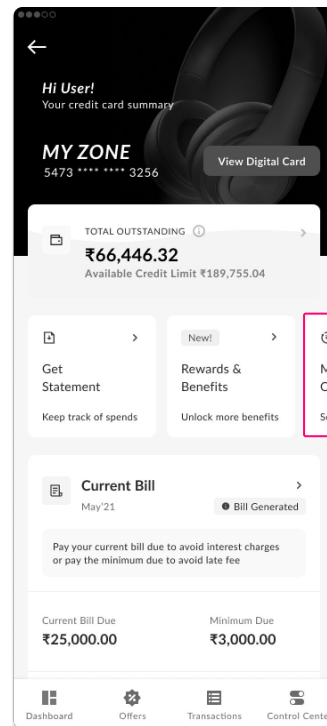

The visibility of the top carousel (containing widget) is high hence the widget was the more popular choice to start navigation.

Users rely more on the copy when navigating or accessing a certain function.

- More than 70% users used the widget to navigate to set limits.
- 50% of users who interacted with Prototype B (where the widget was hidden further in the carousel) still swiped the carousel to access the widget.
- Most users stated 'copy' as the reason for choosing both widget and control center.

PROTOTYPE A: WIDGET SEEN
(used by 8 users)

PROTOTYPE B: WIDGET HIDDEN
(used by 6 users)

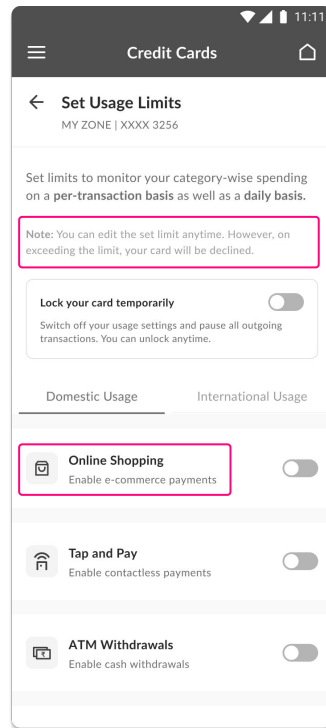

Note and Usage Types

The NOTE had mixed visibility but its importance was ranked generally higher as it is considered as a good-to-have reminder even for seasoned users.

- Half of the users noticed the NOTE by themselves
 - On an average, it was rated 3.1/5 on the importance scale.

While the nomenclature of the usage types are very easy to understand, users preferred the title 'online shopping' more than the subtitle as it is a common term and hence understood easily by all.

- Most users preferred the title

Types of limits

Most users understood both types of limits correctly and there was no particular inclination observed to either of them.

- However, few users (from Tier 2) do not find these limits helpful as they are more concerned with planning their monthly budget, irrespective of usage type.

Other smaller components like the tooltip and slider amounts (2L) were highly visible and easily understandable.

- All users identified both of them correctly

The screenshot shows a mobile app interface for setting credit card usage limits. The title bar is dark grey with a hamburger menu icon on the left, 'Credit Cards' in the center, and a home icon on the right. Below the title bar, the screen is titled 'Set Usage Limits' with a back arrow on the left and the card number 'MY ZONE | XXXX 3256' on the right. A descriptive text block states: 'Set limits to monitor your category-wise spending on a per-transaction basis as well as a daily basis.' Below this is a note: 'Note: You can edit the set limit anytime. However, on exceeding the limit, your card will be declined.' The screen is divided into two tabs: 'Domestic Usage' (selected) and 'International Usage'. Under 'Domestic Usage', there is a toggle switch for 'Online Shopping' (enabled) with the subtext 'Enable e-commerce payments'. Below the toggle, there are two limit settings: 'Per-Transaction Limit' and 'Daily Limit'. Both are currently set to '₹ 2,00,000'. The 'Per-Transaction Limit' section includes a slider with markers at ₹100, ₹1L, and ₹2L. The 'Daily Limit' section has a small information icon and the text 'Maximum limit reached'. At the bottom, there are two buttons: 'Cancel' and 'Save Changes'.

Setting the limits

Preference for limit input— slider or typing— is mixed. While it initially depends on the amount type, the choice is also between an easier interaction (sliding) or quicker completion (typing).

- The choice for limit input initially depends on the amount type
 - slider for whole multiples (ex. 10,000)
 - typing for odd amounts (ex. 13,000).
- Though sliders are easy to interact, it may take a few seconds more to set it to the exact amount needed (depending on its intervals).
- Though typing might also take a few extra seconds it ensures that the input is exact in one go.
- Most 40+ age cohort preferred 'typing' indicating sliders might be difficult for them.

The screenshot shows a mobile app interface for setting credit card usage limits. The title bar at the top says "Credit Cards". Below it, the screen is titled "Set Usage Limits" with a card number "MY ZONE | XXXX 3256". A note states: "Set limits to monitor your category-wise spending on a per-transaction basis as well as a daily basis. Note: You can edit the set limit anytime. However, on exceeding the limit, your card will be declined." There are two tabs: "Domestic Usage" (selected) and "International Usage". Under "Domestic Usage", there is a toggle for "Online Shopping" (enabled). Below that, the "Per-Transaction Limit" is set to ₹ 2,00,000, with a slider ranging from ₹100 to ₹2L. The "Daily Limit" is also set to ₹ 2,00,000, with a note "Maximum limit reached". At the bottom, there are "Cancel" and "Save Changes" buttons.

Saving the changes

Users expect some sort of feedback after saving the changes they made to their usage limits.

- Half of the users expect a popup
- Few expect an email or sms (from previous experience)
- A user also expects notifications.

The screenshot shows a mobile app interface for setting credit card usage limits. The title bar at the top is dark grey with a hamburger menu icon on the left, the text "Credit Cards" in the center, and a home icon on the right. Below the title bar, there is a back arrow icon and the text "Set Usage Limits" followed by "MY ZONE | XXXX 3256". The main content area has a light grey background and contains the following elements: a paragraph explaining the purpose of the limits, a note about editing limits, two tabs for "Domestic Usage" and "International Usage", a toggle switch for "Online Shopping", a slider for "Per-Transaction Limit" ranging from ₹100 to ₹2L with a current value of ₹2,00,000, and a "Daily Limit" section with a value of ₹2,00,000 and a note "Maximum limit reached". At the bottom, there are two buttons: "Cancel" and "Save Changes". The "Save Changes" button is highlighted with a red rectangular border.

Managing usage for add-on cards

Most such users successfully navigated and managed limits for their add on cards.

- All the add-on cards in our cohort belonged to and was used by a family member.
- But the management of the add-on card, like paying bills, checking credit limit, etc is handled by the primary user.
- A user had issue finding the card listing since his usage of the Axis app is very low.
- A premium, HNI finds it tiring and time consuming to update settings (ex. limits) for each of his cards individually.

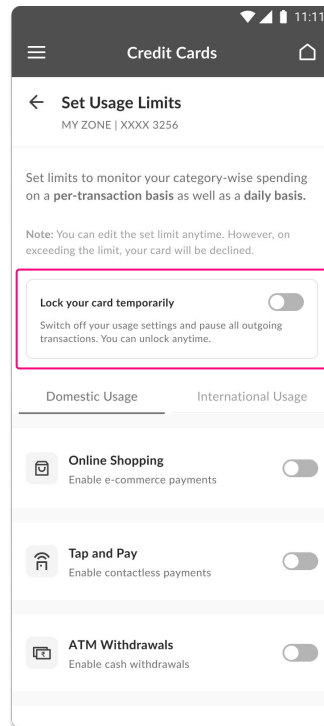

Locking the Card

Card Lock- Visibility

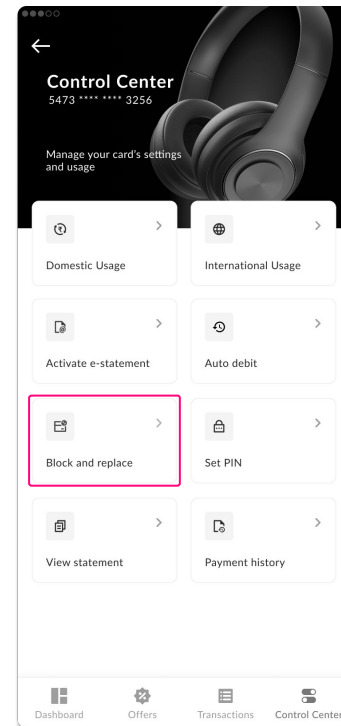

The visibility of the 'Lock' section is quite high since the title of the section, having a bigger font, is easily noticed.

But the awareness for the 'Block and Replace' feature is higher; it was the first choice of navigation for 50% of the users.

- Half of the users navigated to 'Lock' successfully and most of these were aware about the feature from previous experience.
- The rest half took more time to decide and chose to navigate to 'Block and Replace'.

CARD LOCK
IN MANAGE USAGE

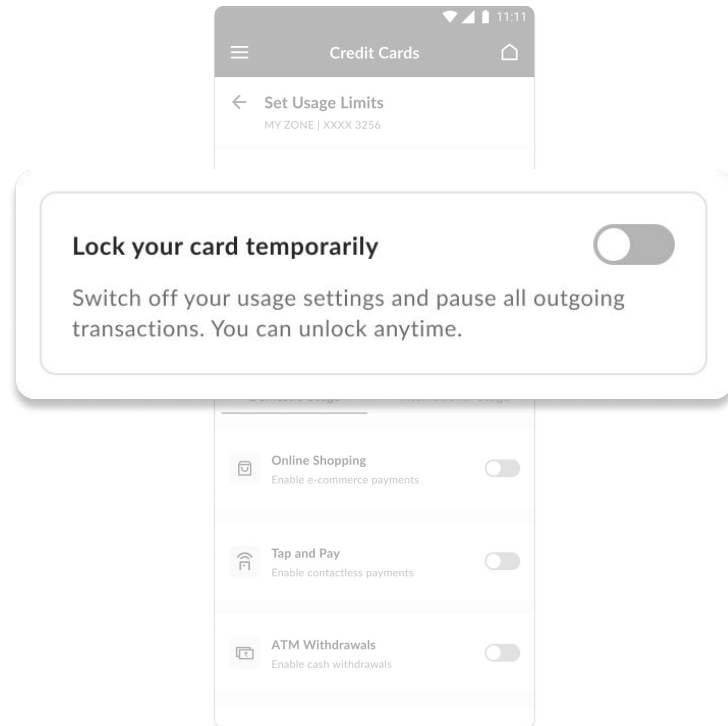

BLOCK & REPLACE
IN CONTROL CENTER

Lock or Block?

There is a lack of understanding about the difference between 'Lock' and 'Block', especially among users who have less than 5 years of experience using a credit card.

The subtext is better at helping understand the function than the title but the subtext is not able to catch user attention as it is similar to other low priority information in the section around it.

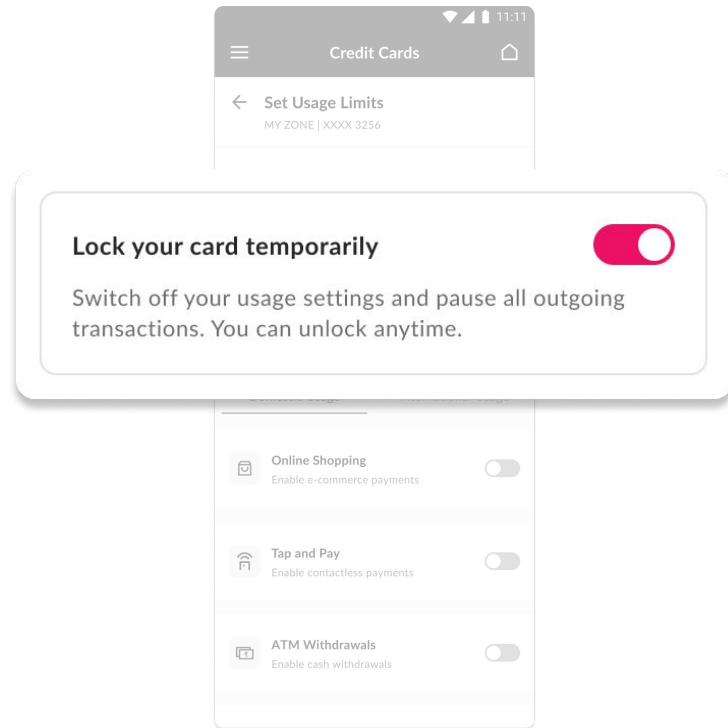

- Most users glanced at the title 'Lock your card temporarily' when managing usage limits
 - But few of these still had issues navigating to it as simply seeing/ glancing at the title wasn't enough to convey its function.

Locking the card- Suggestions

While almost half of the users had difficulty understanding and finding the feature, they did not have any issues regarding it as it was a new and helpful function for them.

- A user had issues reading the subtext as the font size was smaller for them and it did not pop.
- A user had difficulty understanding the function even after reading the subtext; he could not comprehend how 'unlock anytime' would work.
- Very few users felt 'Lock' feature is better situated in the control center or 'Block & Replace' rather than 'Manage usage'.

Pay Now

Pay Now: Process Feedback

Overall, the process of paying their credit card bill is easy for all users. On an average, it was rated 4.8/5

There were no particular areas of friction.

Except very few users who misunderstood the CASA amount because the comma was illegible.

LEAST EASY

MOST EASY

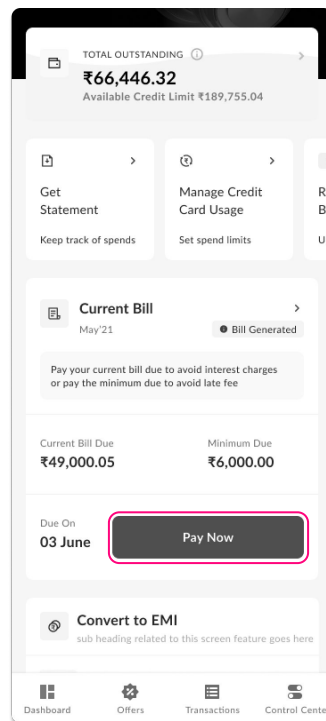

4.8

USERS SAY:
VERY EASY

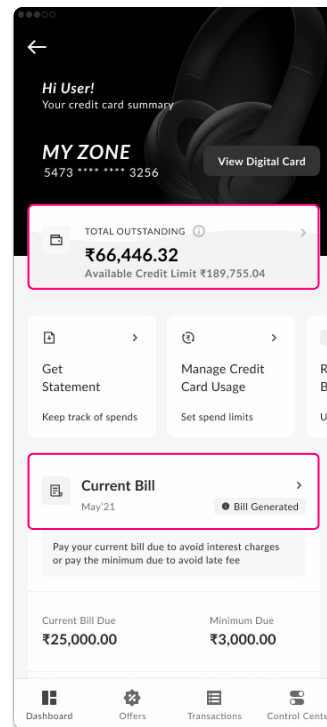

Choice of Navigation- Start Point

The 'Pay Now' button on the dashboard is highly visible and is the most popular choice to navigate for credit card bill payment. Almost 70% users chose to navigate from here to pay the bill.

- The next two popular choices are
 - Current Bill Arrow- since it's the same section as the 'Pay Now' button.
 - Total Outstanding- due to its placement users notice it first and it also has the amount displayed.

PRIMARY CHOICE

ALTERNATIVE CHOICES

Preference- Type of bill

The awareness and understanding of the amount and bill types (Total Outstanding, Current, Minimum) is very high, all users understood all the terms correctly.

The 'Current Bill Due' is the most preferred choice of bill.

- Almost all users prefer paying 'Current Bill Due'
- Some users ranked 'Pay Other Amount' as least preferable
 - Very few users (Non Premium, Tier 2) choose to pay other amount when they are low on funds.
- The lower preference of 'Pay Other Amount' also hints to the lack of awareness of extra charges within it.
 - Only some users are aware about the extra charges when paying 'Minimum Due'.

Preferences- Bill Summary

On the payment summary page, users are most focussed on the 'Bill Details' section followed by the 'Mode of Payment' section.

Both these contain the needful information to check before confirming payment.

- Few users focus on the sections as they are
- Most focus first more on 'Bill details' section

A lot of users prefer to pay their credit card bill using UPI and it's one of the main reasons to use CRED. Some users who pay through their savings account still choose to do it through CRED since they may use a non-Axis bank account when funds are insufficient.

Confirm and Pay

Preferences- Payment Mode and App

More than 60% users prefer settling their credit card bill through CRED, the most popular reason being the cashback/ rewards/offers received.

- More than half of them use it for paying via UPI
- Some of them also like the reminders it provides
- Most of the Non-Premium card holders are using CRED
- Most of the users having low experience using credit card (less than 5 years) also used CRED

OTHER
BANK APPS

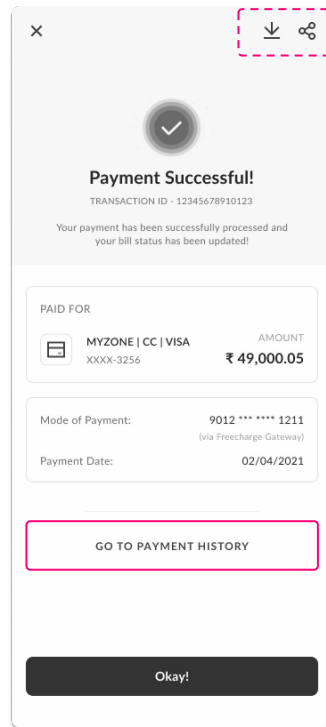

Behavior Post Payment

While the visibility of 'Download/ Share' component is very high, only few users 'share' the receipts when required as proof of payment.

- Half of them don't need it as they receive it on the email which is sufficient
- Few of them don't need it at all

Visibility of the 'Payment history' component is very high but it's a less used option as users want to go back to the homescreen after paying the bill since their major need (of paying credit card bill) is done.

- A non-premium, Tier 2 user tries to keep in mind the leftover due amount after paying partial credit card bill so that he budget accordingly and gear up the mindset for the next payment.

Executive Summary 1/3

MANAGE USAGE

- Overall, the process is easy for all users with an average rating of 4.5/5 for ease. There were no particular areas of friction.
- The frequency of users managing/ changing usage limits is very low but it is still an important function with an average rating of 3.8/5 for importance.
- Widget is the most used point of navigation to Manage Usage due to its copy and placement.
- The process is easy for users with multiple and add-on cards as well.
- Visibility of 'Lock' is high but awareness of the function is low. Some of the users confuse it with 'Block'. The subtext explaining the 'Lock' function can be visually enhanced to grab more user attention and thus increase awareness.

PAY NOW

- Overall, the process is easy for all users with an average rating of 4.8/5 for ease. There were no particular areas of friction.
- 'Pay Now' button is the most used point of navigation due to its copy and highlighted look.
- The awareness and understanding of the bill types (Total Outstanding, Current, Minimum) is very high.
- The 'Current Bill Due' is the most preferred choice of bill.
- Most users prefer paying through UPI as it is quick and convenient.
- CRED is a popular choice for the cashback, rewards, and offers. It is widely used by non-premium users and users having less than 5 years of experience using credit card.

Executive Summary 2/3

OLIVE REVAMP

.....

- The central card section is the most eye catching due to the attractive card image and lighter components highlighting well over the darker background.
- Upgradation section has high visibility but users were not actively enthusiastic about it.
- The 'Total Limit Breakup' section is highly visible, easy and useful. It has an average rating of 4.8/5 for ease and 4.4/5 for helpfulness.
- The process itself of unboxing is quite easy with an average rating of 3.6/5. The major issues are discoverability of the banner and interacting with it. Users mistake it for an ad and scroll down instead of swiping down.

OLIVE REVAMP

.....

- Overall both versions of the revamp have almost equal preference. However, Non Premium preferred Revamp A (darker) slightly more and Premium Users preferred Revamp B (lighter) slightly more.
- Users who prefer Revamp A, like the colour which is attractive, and premium. They like that the buttons and info pop out against the darker background, increasing visibility. They like that all the important functions are quickly accessible, eliminating the need to scroll down.
- Users who prefer Revamp B, also like the color which is soothing and premium. They like that the add on pills are located upfront. They like the greeting that adds a personalized touch.

Executive Summary 3/3

OLIVE REVAMP

.....

- The major user needs for card switching are ease of use and faster switching.
- The order of preference for switching cards is Pills > Filter > Dropdown
- Pills is the quickest mode as the navigation is limited to a single page/ section. But the contrast of the Pills can be improved to make them pop more.
- Filter is popular for the ability to multi select cards. But the icon does not align with user expectations.
- The Dropdown is easy but it comparatively takes the most time to switch cards and also doesn't allow multi select.
- Users prefer the View add-ons written on the card as it's quickly visible than having it as a button below the card. The Quickview section is also easy for users to understand.
