- **FINDINGS OVERVIEW**
- **CVCE DIGITAL ECOSYSTEM**
- **FIELD EVIDENCE**

RESEARCH GOAL

The study aims to dissect the end-to-end realities of the Credit and Operations phases for CVCE loans. It focuses on exposing the manual redundancies, offline "shadow" dependencies, and severe system UI limitations that create operational bottlenecks and delay Turn Around Times (TAT).

- Understand the daily workflows of Credit and Operations staff.
- Pinpoint system limitations and offline workarounds.
- Assess the time cost of redundant Maker-Checker verification stages.
- Evaluate overall efficiency compared to current industry standards.

USER PROFILE & METHODOLOGY

Sr. No	Staff Name	Designation	Loan Type	Location
1	Rosbin Cyrill	ACM	CVCE	Kalina
2	Sumit	CPA-Ops Maker	CVCE & Auto	Kalina
3	Saurabh	Ops Checker	CVCE & Auto	Kalina

~60 minute user interview sessions and observation were conducted with Credit and Operations team at Axis Loan Centers-Kalina.

EXECUTIVE SUMMARY

- Leads enter via Siddhi or dealerships with a 60/40 split between DSA and direct channels . Customers frequently provide incomplete data or sign blank forms, forcing operations staff into a bottleneck of chasing missing documentation .
- FinnOne cannot parse raw data efficiently, forcing the Credit team to build the Credit Appraisal Memo (CAM) entirely offline in Excel, requiring 1 to 2 hours per case just for financial plotting . Severe system character limits and UI glitches (such as the "1-to-9" save hack) make system input highly haphazard .
- Core file login consumes 45 to 60 minutes per application across Quick Data Entry (QDE) and Detail Data Entry (DDE) . Makers perform grueling physical audits, verifying up to 34 signatures per registerable asset , and handle heavily flawed files that can generate up to 30 manual queries .

EXECUTIVE SUMMARY

- Minor data discrepancies, unmapped dealers, or missing mandatory PEP declarations trigger absolute system hard-stops . Furthermore, Shikhar tracking IDs expire after 30 days, forcing a complete workflow reset (new CAS-ID and Shikhar ID) if decisions are delayed .
- Despite intensive audits by the Maker, Operations Checkers must spend an unavoidable 15 to 20 minutes pulling the physical file again to re-verify the exact same data points before initiating the SIP and disbursement
- Unlike competitor banks that utilize automated portals for direct sales document uploads and auto-sanctioning, the current CVCE ecosystem relies on brute-force manual data entry and redundant offline tracking

FINDINGS OVERVIEW

Stage 1: Credit Intake & Triage

- Credit receives deals from the CPC team via email containing a ZIP file .
- The payload includes the commercial CIBIL (e.g., Gentec Solutions), individual co-applicant CIBILs, ITRs, GSTRs, Perfios banking data, and a raw Cam template .
- System Routing Segregation: Loans under 1 CR are handled via Omni (Central Processing Team in Delhi), while loans over 10 CR (OS cases) bypass FinnOne entirely and are processed via Word documents by the COB team in Airoli .

FINDINGS OVERVIEW

Offline CAM Generation

- FinnOne **cannot parse the raw data efficiently**, forcing the ACM to build the CAM completely offline in a complex Excel template.
- The Excel CAM captures Capex (e.g., 3532 Tipper, 2 units, 90% LTV, 60 months) and tracks existing fleet and banking details.
- Financial plotting requires **manually tallying** at least two years of net profits, ensuring assets and liabilities match to a zero difference in a separate **Financial Validation Sheet**.
- The ACM calculates ratios, turnover, PAT, EBITDA, and provisionals for the fiscal year.

FINANCIAL VALIDATION SHEET

FINDINGS OVERVIEW

Tele-PD & Risk Justification

- The ACM conducts **Tele-PDs or physical visits** (e.g., Palghar RMC unit visit) to draft the customer profile .
- The ACM identifies DPDs (e.g., 30, 33, 56, 25 days delay) and **analyzes CIBILs for NPA strings** (e.g., in one case the records showed : 85, 148 days NPA post-Covid, or 129 days past due) .
- These delays require **manual documentation of mitigants**, investigating whether delays were due to said reason (here Covid), or **principal payment delays**, or **asset accidents**.

“

DPDs as in he had delayed his payments. Jaise yeh wala case jo maine mere boss ko daala hai isme dekho iska delays hai. He has delayed by 30 days, 33 days, 56 days, 25 days. Toh if you're funding this customer it is a risk for the bank. Matlab aage jaake yeh bhi DPDs mein aa sakta hai.

”

FINDINGS OVERVIEW

System UI Limitations

- Underwriting is a separate FinnOne tab inaccessible to the CPC DDE team.
- **Character and word limits** force the CAM to be **manually broken** into "profile continued 1, continued 2" sections .
- Pasting all (eg. 47 points) CAM points at once **scrambles the serial hierarchy entirely** . The workaround **requires pasting points 1 to 9**, saving, and then continuing .
- FinnOne **auto-logouts and wipes unsaved data**; staff hack this by keeping the "**Do you want to logout?**" prompt **on standby** to keep the session alive while on calls .

“

Isme kya hota hai na main FinnOne mein bahut saare limitations hain, jaise jo main comments daalta hoon na, toh wahan pe main copy paste karta hoon. Uska number of words ka limitation hai, characters ka limitation hai. Toh woh part-part mein mere ko karna padta hai

”

The Revert Loop & Approvals

- Because the FinnOne **UI jumbles text**, the offline Excel CAM is often emailed directly to approvers to ensure line-by-line clarity .
- Regional Credit Managers frequently approve cases via the mobile application to bypass desktop friction .
- Booking Ops verifies the DDE against Credit's comments.
- **Minor discrepancies** spotted by Ops (e.g., "Max Motors" on an invoice when another dealer was entered in data entry) **trigger full pushbacks**.
- Credit corrects it and requests re-approval. eg comment: "Re-approval requested as KFS was updated, no changes in other approved terms" .

FINDINGS OVERVIEW

Stage 2: Physical Audit Phase (Ops Maker)

- Before data entry in FinnOne, the **Maker manually audits the physical docket** for fully filled KYC, FCU stamps, OVDs, Aadhaar masking, cross-signs, and customer signatures .
- Verifies self-attested business documents (Udyam, GST, financials) or email receipts, and checks fleet lists classifying assets as retail, strategic, or super-strategic .
- Registerable assets (vehicles with wheels) **require up to 34 signatures** on RTO copies and Form 21 . Non-registerable assets (excavator tracks) bypass RTO copy signatures .

MANUAL AUDIT OF PHYSICAL DOCKET

“

Ek file poora karne ke liye kam se kam 40 to 45 minutes jayega.

”

FINDINGS OVERVIEW

Exception Handling & Addendum

- Name mismatches (e.g., PAN "Sandeep Bhai Patil" vs. Aadhaar "Sandeep Yuvraj Patil") mandate physical self-declaration sign-offs .
- The Maker checks insurance addendum (Tata/Bajaj cross-sells), calculating premiums based on the customer's DOB using external calculators .
- Mandatory audits include LEI declarations (mandatory for >5 CR turnover), Authority letters, PEP documents, and Margin Money Receipts (MMR) .

(L-R, CLOCKWISE): CONSENT LETTER, AUTHORITY LETTER, QUERY LIST TRACKER AND LANGUAGE DECLARATION

FINDINGS OVERVIEW

Off-System Verification & Tracking

- The Maker verifies **Udyam Registration Certificates** on the official government site, frequently navigating site downtimes .
- Stamp duty is calculated offline: >10L loan = 0.5%, <10L = 0.2%, with a Guarantor adding an extra 0.2% .
- Staff build custom **personal Excel sheets** to track required documents per product (Auto vs CVCE) because the system lacks dynamic checklists.

PERSONAL EXCEL SHEETS & CALCULATOR

FINDINGS OVERVIEW

Rate Friction & KFS Bottleneck

- Sanction letters contain fractional rates (e.g., 9.123%) You get a 60-day break before making your first payment, but interest still adds up every single day you wait.
- Because the math is a weird decimal and changes daily, nobody knows what your exact monthly bill will be until the exact day the deal is officially signed and locked.
- The Maker **cannot finalize processing until NSM/ZSM-level rate approvals**, discounting approvals, and NOD (Net of Discount) pricing are confirmed .

SANCTION LETTER & CORRESPONDENCE FOR RATE NEGOTIATION

“

Problem sir wahi hai main matlab inko time pe rate milta nahi aur inka file incompletes aata hai hamein bas wahi problem hai.

”

FINDINGS OVERVIEW

Stage 3: P-Doc Data Entry

- The Maker enters instrument details (NACH/cheque), MICR codes, and selects account types (Current/Savings/NRI) .
- Selecting manual NACH mandates NSM-level approval, while e-NACH does not .
- Waivers require manually typing three distinct entries (Processing Fee, Rate of Interest, Foreclosure) detailing the exact approval authority (e.g., Ashish Mehra/NSH) .
- Target dates and TATs (e.g., 1 month) are manually set for deferred documents like pending RC copies .

FINDINGS OVERVIEW

System Hard-Stops & Query Routing

- Missing mobile/email verification or omitting the mandatory "Aadhaar scanning success" flag halts the case entirely .
- Incomplete files generate massive queries—up to 30 per file .
- Queries are tracked in an Excel sheet, split into Credit (red mark) and Ops, then manually pasted into the Shikhar portal and emailed .

“

Agar unke paas se file jaise aisa yeh poora incomplete aayega, abhi yeh file mein aapko query dikhaun na sir... toh almost 30 queries tha.

”

FINDINGS OVERVIEW

Stage 4: QC & Tajora Handoff

- The Maker runs the "Tajora" code in P-Doc to initiate stage change to the Checker (QC) .
- The Checker is forced to pull the physical file again to re-verify the Maker's data entry, specifically checking instrument details, EMIs, and dealer mapping .
- This redundant manual check consumes 15 to 20 minutes per file .

“

Jaisa woh check karta hai waise mujhe check karna hai. Minimum ek ghanta nahi, minimum kam se kam bees minute jata hai poora.

”

“

Baaki bankon mein process kya hai online hai. Actually jo data entry yeh sab kar rahe hain na, CPA yahan pe, woh sab data entry CPA hi nahi karta tha. Woh sales manager hi sab karke portal mein update karta tha.

”

FINDINGS OVERVIEW

SIP & CIBIL Generation

- The Ops system requires generating a "dummy CIBIL" during P-Doc to bypass a hard stop, even though Credit already evaluated actual CIBILs .
- Since Ops staff aren't legally allowed to look at real credit scores, the software just generates a fake ("dummy") score. It is literally a fake data entry just to trick the system into unlocking the "Next" button.
- The Checker finalizes the cycle period (e.g., 1st, 5th, 15th), triggers NACH/e-NACH, and initiates the SIP to generate the Cust-ID .

DUMMY CIBIL

FINDINGS OVERVIEW

Stage 5: Disbursement Initiate (DI)

- The Checker triggers "Change Stage" moving the case to DI (Disbursement Initiate) .
- The central Ops team in Noida (Centram) extracts the FinnOne Cache dump, updates Last Activity, generates the Loan Account Number (LAN), and triggers dealer payment

CVCE DIGITAL ECOSYSTEM

Industry Contrast

- Competitor banks (e.g., Bank of Baroda) feature superior digital infrastructure where account child IDs generate in one minute via portal buttons, versus Axis requiring overnight day-end processing .
- Competitor sales teams upload documents directly to automated portals, restricting Ops strictly to verification rather than heavy manual data entry

CVCE DIGITAL ECOSYSTEM
